HPAI H5N1 in fur animals in Finland

Niina Tammiranta

Principal Researcher

DVM, Specialist in Veterinary Medicine, Infectious
Animal Diseases

Laboratory and Research Division / Veterinary Virology

**Annual Meeting of the NRLs for AI and
ND of EU Member States 2023**

2.-3.10.2023

Background of fur farming in Finland

- 450 active fur animal farms
 - 95% of the fur production (1,3 million animals annually) in western Finland (the Ostrobothnia region)
 - Finland has been one of the largest fur producers in Europe
- Animals commercially farmed for fur production:
 - American mink (*Neovison vison*)
 - Arctic (blue) fox (*Vulpes lagopus*)
 - Red (silver) fox (*Vulpes vulpes*)
 - Fox crossbreeds
 - Raccoon dog (*Nyctereutes procyonoides*)

- Animals are usually kept in side-by-side wire cages in narrow sheds which are only covered by a roof and have no closed walls
- Animals are mainly fed with fresh feed manufactured in feed kitchens, but some farmers make feed themselves
 - Intra-species recycling in foxes and raccoon dogs but not in minks

History of HPAI in Finland

- First HPAI cases in 2016
 - Only in wild birds (H5N8)
- Cases in wild birds almost every year since then
 - Worst year 2021: 66 cases / 110 positive birds (H5N8 and H5N1)
- Only one poultry case
 - Farmed pheasants in 2021 (H5N8)
- Cases in wild mammals
 - 2021: two red foxes and otter (H5N1)
 - 2022: lynx and otter (H5N1)

HPAI H5N1 outbreaks in fur animal farms 2023

- Dead animals sent for disease investigation due to mortality and clinical signs
 - Routine necropsy and microscopic examination were performed
 - Most animals: pneumonia and septicemia
 - Some animals: diarrhea
 - Samples for virus detection
 - Organs and swabs
- **First HPAI H5N1 case confirmed on 13 July 2023 (arctic fox)**

HPAI cases 2023

- 27 positive farms (situation 29.9.2023):
 - 18 farms with foxes only
 - 4 farms with foxes and minks
 - 3 farms with foxes and raccoon dogs
 - 1 farm with foxes, minks and raccoon dogs
 - 1 farm with raccoon dogs only
- Total number of animals on positive farms:
about 255 000
- 31 cases in wild birds
- 2 cases in wild mammals (red fox and otter)

Control measures on fur farms

- Official restrictions to infected or suspected farms
 - Ban of animal movements from and into farm
 - Orders for handling of dead animals, by-products, feed etc.
 - Cleaning and disinfection orders
- Culling
 - At the beginning of the outbreak
 - All minks on positive farms were culled
 - Foxes and raccoon dogs on a case-by-case basis depending on the spread of the disease on the farm, detected mortality and symptoms etc.
 - Starting 11.9.2023 → all animals on infected farms will be culled
 - The total number of animals that will be culled is about 255 000
 - Carcasses are sent to by-product establishment for destruction

Further measures

- Survey on all fur farms in Finland
 - Starting at farms with minks (114 farms)
 - Blood samples for antibody testing, tissue and swab samples for PCR testing → only blood samples
- Improvement of biosecurity on fur farms
- Suspect cases investigated
